

OpenADHD From Zero to Launch Playbook

Nonprofit-style informational hub implementation manual

Mission and Product Promise

OpenADHD exists to make high-quality ADHD help free, practical, and easy to use. The promise is action-first support: users should be able to reach a useful next step in under one minute.

The core product model is one-page understanding, one tool for today, one weekly plan, and one deeper guide. This model is designed for real executive-function constraints, not idealized attention spans.

Every decision should be evaluated through five filters: free-first access, low-friction UX, evidence-aware language, nonjudgmental tone, and personalized pathways.

Information Architecture

Top-level navigation should prioritize utility over brand storytelling. Required sections: Start Here, Tools, Library, Diagnosis and Care, For Students, For Parents and Partners, and About plus Contribute.

Library organization must mirror moments and pain points rather than academic categories. Users search for immediate problems: cannot start, behind in class, time disappeared, conflict at home, medication uncertainty.

Compatibility routes should preserve old links (for example, /resources to /library and /diagnosis to /care) to prevent resource rot and external-link breakage.

MVP Build Sequence

Phase 1 (2-4 weeks): Start Here chooser, 10 high-impact guides, 10 printable templates, Task Breaker and Routine Builder tools, and core care navigation path pages.

Phase 2: Add Study Sprint, Script Library, Student Portal, and improved diagnosis/cost/medication guidance. Introduce save/favorites and lightweight progress tracking.

Phase 3: Add structured community layer, local resource map starter, volunteer program, translation workflow, and partnership playbooks.

Critical constraint: do not scale content volume before delivery quality is stable on the top 20 user journeys.

Content Operating Rules

Each page begins with: what this is, who it is for, and what to do first. This prevents orientation fatigue.

Each deep guide includes TL;DR, minimum viable version, if-you-have-energy mode, and crisis mode. This supports variable capacity across the same user.

Use checklists, section caps, and progress visibility. Avoid walls of text and avoid content that requires uninterrupted long-focus sessions.

High-stakes pages must include educational-only framing and clear crisis routing (988 in the U.S.).

Measurement Framework

Primary metrics: tool completions, template downloads, return visits, time-to-first-helpful-action, and one-click helpfulness rating.

Avoid vanity-only metrics such as pageviews without behavioral outcomes. Page traffic is not equivalent to support impact.

Define healthy latency targets: users should complete first useful action within two minutes from landing.

Review metrics weekly and use evidence of user friction to prioritize product changes.

Governance and Public-Good Trust

Maintain a transparency page covering content creation, review process, funding disclosures, partnerships, and contribution pathways.

Adopt school-friendly licensing intent for templates so educators and support groups can adapt resources without legal friction.

Use an editorial policy that rejects miracle-cure language, unvetted influencer claims, and unsupported medical certainty.

Trust grows from consistency, clarity, and transparent limits as much as from content volume.

OpenADHD educational resource. Not medical advice.
